

FICTIONAL DEMO SUBMISSION

For LMS grading-workflow demonstration only

Assignment 1 - Function Transformations

Student	Chloe Martin
Course	MHF4U - Advanced Functions
Submitted	September 16, 2026
Status	Submitted for grading - demo record

Selected responses

These original responses are intentionally concise and are provided only to demonstrate Moodle submission, download, and grading workflows.

Question 2

The absolute-value graph has vertex $(-2, -4)$ and opens upward with slopes ± 3 . My plotted points are $(-4, 2)$, $(-3, -1)$, $(-2, -4)$, $(-1, -1)$, and $(0, 2)$. The range is $y \geq -4$.

Question 4

I found $f^{-1}(x) = (5x + 7)/3$. Both f and its inverse are linear with non-zero slope, so their domains and ranges are all real numbers.

Question 6

A common error is treating $x - d$ as a shift left. Testing the parent vertex $x = 0$ shows that replacing x with $x - 3$ moves the feature to $x = 3$, so the shift is right.
